## Proposition 8

If straight-lines subtend two consecutive angles of an equilateral and equiangular pentagon then they cut one another in extreme and mean ratio, and their greater pieces are equal to the sides of the pentagon.

For let the two straight-lines,  $AC$  and  $BE$ , cutting one another at point  $H$ , have subtended two consecutive angles, at  $A$  and  $B$  (respectively), of the equilateral and equiangular pentagon  $ABCDE$ . I say that each of them has been cut in extreme and mean ratio at point  $H$ , and that their greater pieces are equal to the sides of the pentagon.

For let the circle  $ABCDE$  have been circumscribed about pentagon  $ABCDE$  [Prop. 4.14]. And since the two straight-lines  $EA$  and  $AB$  are equal to the two (straight-lines)  $AB$  and  $BC$  (respectively), and they contain equal angles, the base  $BE$  is thus equal to the base  $AC$ , and triangle  $ABE$  is equal to triangle  $ABC$ , and the remaining angles will be equal to the remaining angles, respectively, which the equal sides subtend [Prop. 1.4]. Thus, angle  $BAC$  is equal to (angle)  $ABE$ . Thus, (angle)  $AHE$  (is) double (angle)  $BAH$  [Prop. 1.32]. And  $EAC$  is also

double  $BAC$ , inasmuch as circumference  $EDC$  is also double circumference  $CB$  [Props. 3.28, 6.33]. Thus, angle  $HAE$  (is) equal to (angle)  $AHE$ . Hence, straight-line  $HE$  is also equal to (straight-line)  $EA$ —that is to say, to (straight-line)  $AB$  [Prop. 1.6]. And since straight-line  $BA$  is equal to  $AE$ , angle  $ABE$  is also equal to  $AEB$  [Prop. 1.5]. But,  $ABE$  was shown (to be) equal to  $BAH$ . Thus,  $BEA$  is also equal to  $BAH$ . And (angle)  $ABE$  is common to the two triangles  $ABE$  and  $ABH$ . Thus, the remaining angle  $BAE$  is equal to the remaining (angle)  $AHB$  [Prop. 1.32]. Thus, triangle  $ABE$  is equiangular to triangle  $ABH$ . Thus, proportionally, as  $EB$  is to  $BA$ , so  $AB$  (is) to  $BH$  [Prop. 6.4]. And  $BA$  (is) equal to  $EH$ . Thus, as  $BE$  (is) to  $EH$ , so  $EH$  (is) to  $HB$ . And  $BE$  (is) greater than  $EH$ .  $EH$  (is) thus also greater than  $HB$  [Prop. 5.14]. Thus,  $BE$  has been cut in extreme and mean ratio at  $H$ , and the greater piece  $HE$  is equal to the side of the pentagon. So, similarly, we can show that  $AC$  has also been cut in extreme and mean ratio at  $H$ , and that its greater piece  $CH$  is equal to the side of the pentagon. (Which is) the very thing it was required to show.
