## Proposition 9

If a straight-line is cut into equal and unequal (pieces) then the (sum of the) squares on the unequal pieces of the whole (straight-line) is double the (sum of the) square on half (the straight-line) and (the square) on the (difference) between the (equal and unequal) pieces.

For let any straight-line  $AB$  have been cut—equally at  $C$ , and unequally at  $D$ . I say that the (sum of the) squares on  $AD$  and  $DB$  is double the (sum of the squares) on  $AC$  and  $CD$ .

For let  $CE$  have been drawn from (point)  $C$ , at right-angles to  $AB$  [Prop. 1.11], and let it be made equal to each of  $AC$  and  $CB$  [Prop. 1.3], and let  $EA$  and  $EB$  have been joined. And let  $DF$  have been drawn through (point)  $D$ , parallel to  $EC$  [Prop. 1.31], and (let)  $FG$  (have been drawn) through (point)  $F$ , (parallel) to  $AB$  [Prop. 1.31]. And let  $AF$  have been joined. And since  $AC$  is equal to  $CE$ , the angle  $EAC$  is also equal to the (angle)  $AEC$  [Prop. 1.5]. And since the (angle) at  $C$  is a right-angle, the (sum of the) remaining angles (of triangle  $AEC$ ),  $EAC$  and  $AEC$ , is thus equal to one right-angle

[Prop. 1.32]. And they are equal. Thus, (angles)  $CEA$  and  $CAE$  are each half a right-angle. So, for the same (reasons), (angles)  $CEB$  and  $EBC$  are also each half a right-angle. Thus, the whole (angle)  $AEB$  is a right-angle. And since  $GEF$  is half a right-angle, and  $EGF$  (is) a right-angle—for it is equal to the internal and opposite (angle)  $ECB$  [Prop. 1.29]—the remaining (angle)  $EFG$  is thus half a right-angle [Prop. 1.32]. Thus, angle  $GEF$  [is] equal to  $EFG$ . So the side  $EG$  is also equal to the (side)  $GF$  [Prop. 1.6]. Again, since the angle at  $B$  is half a right-angle, and (angle)  $FDB$  (is) a right-angle—for again it is equal to the internal and opposite (angle)  $ECB$  [Prop. 1.29]—the remaining (angle)  $BFD$  is half a right-angle [Prop. 1.32]. Thus, the angle at  $B$  (is) equal to  $DFB$ . So the side  $FD$  is also equal to the side  $DB$  [Prop. 1.6]. And since  $AC$  is equal to  $CE$ , the (square) on  $AC$  (is) also equal to the (square) on  $CE$ . Thus, the (sum of the) squares on  $AC$  and  $CE$  is double the (square) on  $AC$ . And the square on  $EA$  is equal to the (sum of the) squares on  $AC$  and  $CE$ . For angle  $ACE$  (is) a right-angle [Prop. 1.47]. Thus, the (square) on  $EA$  is double the (square) on  $AC$ . Again, since  $EG$  is equal to  $GF$ , the (square) on  $EG$  (is) also equal to the (square) on  $GF$ . Thus, the (sum of the squares) on  $EG$  and  $GF$  is double the square on  $GF$ . And the square on  $EF$  is equal to the (sum of the) squares on  $EG$  and  $GF$  [Prop. 1.47]. Thus, the square on  $EF$  is double the (square) on  $GF$ . And  $GF$  (is) equal to  $CD$  [Prop. 1.34]. Thus, the (square) on  $EF$  is double the (square) on  $CD$ . And the (square) on  $EA$  is also double the (square) on

$AC$ . Thus, the (sum of the) squares on  $AE$  and  $EF$  is double the (sum of the) squares on  $AC$  and  $CD$ . And the square on  $AF$  is equal to the (sum of the squares) on  $AE$  and  $EF$ . For the angle  $AEF$  is a right-angle [Prop. 1.47]. Thus, the square on  $AF$  is double the (sum of the squares) on  $AC$  and  $CD$ . And the (sum of the squares) on  $AD$  and  $DF$  (is) equal to the (square) on  $AF$ . For the angle at  $D$  is a right-angle [Prop. 1.47]. Thus, the (sum of the squares) on  $AD$  and  $DF$  is double the (sum of the) squares on  $AC$  and  $CD$ . And  $DF$  (is) equal to  $DB$ . Thus, the (sum of the) squares on  $AD$  and  $DB$  is double the (sum of the) squares on  $AC$  and  $CD$ .

Thus, if a straight-line is cut into equal and unequal (pieces) then the (sum of the) squares on the unequal pieces of the whole (straight-line) is double the (sum of the) square on half (the straight-line) and (the square) on the (difference) between the (equal and unequal) pieces. (Which is) the very thing it was required to show.
