# $29^{\text {th }}$ International Mathematical Olympiad <br> Canberra, Australia 

Day I

1. Consider two coplanar circles of radii $R$ and $r(R>r)$ with the same center. Let $P$ be a fixed point on the smaller circle and $B$ a variable point on the larger circle. The line $B P$ meets the larger circle again at $C$. The perpendicular $l$ to $B P$ at $P$ meets the smaller circle again at $A$. (If $l$ is tangent to the circle at $P$ then $A=P$.)
(i) Find the set of values of $B C^{2}+C A^{2}+A B^{2}$.
(ii) Find the locus of the midpoint of $B C$.
2. Let $n$ be a positive integer and let $A_{1}, A_{2}, \ldots, A_{2 n+1}$ be subsets of a set $B$. Suppose that
(a) Each $A_{i}$ has exactly $2 n$ elements,
(b) Each $A_{i} \cap A_{j}(1 \leq i<j \leq 2 n+1)$ contains exactly one element, and
(c) Every element of $B$ belongs to at least two of the $A_{i}$.

For which values of $n$ can one assign to every element of $B$ one of the numbers 0 and 1 in such a way that $A_{i}$ has 0 assigned to exactly $n$ of its elements?
3. A function $f$ is defined on the positive integers by

$$
\begin{aligned}
f(1) & =1, \quad f(3)=3, \\
f(2 n) & =f(n), \\
f(4 n+1) & =2 f(2 n+1)-f(n), \\
f(4 n+3) & =3 f(2 n+1)-2 f(n),
\end{aligned}
$$

for all positive integers $n$.
Determine the number of positive integers $n$, less than or equal to 1988 , for which $f(n)=n$.

4. Show that set of real numbers $x$ which satisfy the inequality

$$
\sum_{k=1}^{70} \frac{k}{x-k} \geq \frac{5}{4}
$$

is a union of disjoint intervals, the sum of whose lengths is 1988.
5. $A B C$ is a triangle right-angled at $A$, and $D$ is the foot of the altitude from $A$. The straight line joining the incenters of the triangles $A B D, A C D$ intersects the sides $A B, A C$ at the points $K, L$ respectively. $S$ and $T$ denote the areas of the triangles $A B C$ and $A K L$ respectively. Show that $S \geq 2 T$.
6. Let $a$ and $b$ be positive integers such that $a b+1$ divides $a^{2}+b^{2}$. Show that

$$
\frac{a^{2}+b^{2}}{a b+1}
$$

is the square of an integer.
